

1980

Kunihiko Fukushima creates Neocognitron, an artificial neural network that learned how to recognize visual patterns.

His work led to the development of the first convolutional neural networks, which are based on the visual cortex organization found in animals.

1980

1987

1987 - Second AI Winter

Many AI projects expectations had run much higher than what was actually possible.

Over 300 AI companies had shutdown, gone bankrupt, or been acquired by the end of 1993, effectively ending the first commercial wave of AI.

His work led to the development of the first convolutional neural networks, which are based on the visual cortex organization found in animals.

1993

Increasing computing power and focusing on specific isolated problems let AI be more successful than ever.

1997

IBM's chess-playing computer Deep Blue beats the world chess champion Garry Kasparov.

1997

Algorithms originally developed by AI researchers began to appear as parts of larger systems. AI had solved a lot of very difficult problems and their solutions proved to be useful throughout the technology industry, such as data mining, industrial robotics, logistics, speech recognition, banking software, medical diagnosis and Google's search engine.
